A friend and I were driving home from fishing last weekend, down a road with a lot of traffic, when I noticed a deer. The deer was looking back at me, staring into the drivers side mirror. We didn't know it at the time, but the deer was curious about something behind us. Once we turned the corner, the deer looked around and decided to run through the middle of the road into the oncoming lane. I wasn't too excited about hitting the deer, and this was on a public road. I took the opportunity to take a video of the whole thing. By the time I had my gun out, the deer was already going to the side of the road. Then I had to use my elbow to get it back to the middle of the road, so I could get a shot off. This deer turned out to be a big one, as I couldn't get it off the road fast enough. I am lucky I didn't get to run over it.Q: Filtering an XML feed to only display certain data We are using a third party data feed to pull account number, balance, interest rate, and payment history information into our C# application. The data feed is XML and we're using Linq-to-XML to query it. Because the XML feed pulls a lot of data (around 200 lines) we've been filtering it out using XSLT to only pull the account and payment history into our application. We also have a helper

Markup Assist lets you easily capture text and annotations from paper and PDFs and quickly add it to your design. Just drag and drop, then mark the text up for editing by selecting the text and hitting the Select button. If you want to edit the text, just double-click to edit the text in your drawing. (video: 2:47 min.) With Markup Import, you can import the text and annotations from a PDF and add them to your drawings in one click. Just open the PDF, then select the files to import from the list. The system will look for these files and import them into the drawing. You can edit these automatically imported text strings in your drawing and close them at any time. (video: 2:19 min.) Be sure to check out our other exciting AutoCAD 2023 updates here. Fusion 360: Fusion 360 is the only 3D-modeling app on the market with native and free access to AutoCAD files. Use Fusion 360 to create CAD models, animations, and even architectural designs that you can send directly to AutoCAD or save to DWG. (video: 9:12 min.) New: Inch modeler supports horizontal and vertical grids: The Inch Grid option in the Modeling Toolbars lets you choose a horizontal or vertical grid for your models. The dimensions of a model created using the Inch Grid option are based on a single, linear grid – that is, the vertical or horizontal lines remain horizontal or vertical. The Grid lines are not placed in a parallel or perpendicular grid, and the direction of the grid lines is not based on the direction of rotation. (video: 0:42 min.) With the new option to use a horizontal or vertical grid, the grid lines are not placed in a parallel or perpendicular grid. Instead, the grid lines are based on a single linear grid. Work from models with different grid styles: When you work with multiple models in a drawing with multiple grids, the current grid type is automatically applied to the model. For example, if you create a model in Drafts with Drafts grids, it will use Drafts grids when you export the model. If you create the model in Inch with Inch grids, it will use Inch grids when you export the model. The grid dimensions for a model remain consistent across applications: When you import the model into another application, you can specify a default
