We have now performed RT-qPCR assays for the expression of the monocyte marker CD14, in order to determine the purity of the monocyte population. As shown in Figure 1, the *CD14* gene expression is consistently higher in monocytes than in NK cells. These results indicate that, at least in this particular case, CD14 expression could be used as a quality control assay for the purity of the monocyte population. Concluding remarks {#emmm201505413-sec-0004} ===== In this work, we describe a modified and practical method to isolate human primary monocytes with high purity, taking advantage of the well-known property of homogeneity of CD14 staining on the surface of monocytes. This method can be easily applied to a wide range of applications
