Launch4j is a software utility that allows users to wrap Java applications into Windows native executable programs. We all know how tiresome it can get to open a Java-based application on Windows, and this is why Launch4j comes in handy for all users who want to run JAR files as regular Windows programs. You may convert Java applications on Windows, Linux, Mac OS X and Solaris. Although the user interface is straightforward, there isn't a help menu included in the app that could make the beginners understand how this program works. You cannot drag and drop the files into the main window of the app, so you should add them using the built-in browse option. There are several configuration settings included in the app by the developer that make the entire process easier and faster. You can make Launch4j search for a certain JRE version or use a bundled one by specifying the initial and maximum heap size. If the app is not able to open a JAR file or some errors occur during the process, then it automatically opens the Java download page or a support website. The program also allows users to simply launch the Java application, without having to convert it into a Windows appropriate file format. Moreover, you can make the app display native JRE splash screen in BMP format until the program manages to open the Java applications. All things considered, Launch4j is a handy tool that can help you wrap Java based programs into Windows executable files. Although it cannot be described as the most powerful tool in its category, it packs enough features for converting or opening Java based applications pretty quickly. Launch4j (4.7) A nice and simple to use program launcher that can launch your favorite Java applications, that are installed in the JRE. 4.6 have a problem when it is executing jrun.jar because it has a bug. What are the performance considerations of using typed collections? So I've been looking at the typed collections and I've come to the conclusion that they add a small amount of overhead on top of using a generic collection. But my concern is that this overhead may be unacceptable for my project because I will have a lot of items in the collection. So the question is this: will using a typed collection cause performance issues? Is it even worth it? A: Usually, no. If you are storing a large number of objects, a collection of (say) 1,000,000,000 items is going to be slower than a generic collection (of the same size) and there is very little to gain. A: There's probably not a very big difference in performance, but there are some benefits to using a typed collection. First off, if you look at it from the perspective of how the CLR deals with object type references, you'll notice that it is very fast at interpreting what an object refers to. In the JIT, this is called constant folding and while it usually has to do with dereferences, it also applies to the stuff that references other object types. That's why most of the time is spent on the garbage collector when you have a lot of objects in memory. If you want to use that as an advantage, you have to also take into account that this is not shared among the types, so it can have side-effects on the performance of other types. The other advantage is that typed collections are more readable, since it is clear when you should cast the object you're going to use. The overall objective of this proposal is to investigate the molecular basis of the hormone-mediated induction of a limited set of hepatic and pancreatic genes, with the emphasis on the mechanism of induction of the hepatic metallothionein genes. Our hypothesis is that the hormone-mediated induction of this class of genes is controlled by the structure and composition of the nucleoprotein complex that is formed at the promoter region of the genes. Two specific aims have been developed to test this hypothesis. (1) To investigate the formation of the nucleoprotein complex on the promoter region of the metallothionein gene(s) during the hormone-mediated induction process. Experiments will be carried
